SPECIFICATION

Compounds having reversible inhibiting activity of

carnitine palmitoyl-transferase

This appln is a cont of PCT/IT99/00126 filed May 11, 1999.
The present invention relates to compounds having inhibiting

activity against carnitine palmitoyl transferase. The present
5 invention relates also to pharmaceutical compositions containing at
least one of these compounds active ingredients and to the use of
said compounds in the preparation of medicaments useful in the
treatment of pathologies related to a hyperactivity of carnitine
palmitoyl-transferase, in particular hyperglycaemic states, such as
10 diabetes and related pathologies and of congestive heart failure.

Background of the invention

To date, hypoglycaemic therapy is based on the use of drugs
having different mechanism of action (Arch. Intern. Med., 1997, 157,
1802-1817).

15 Insulin and its analogues represent the most used therapy,
recurring to the direct hypoglycaemic action of this hormone.

Other compounds act indirectly by stimulating insulin release
(sulphonylureas). A different target of hypoglycaemic drugs is
represented by the reduction of glucose intestinal absorption
20 through the inhibition of intestinal glucosidases, or by reducing
insulin resistance.

Hyperglycaemia is also treated with gluconeogenesis inhibitors,
such as biguanides.

2

./.

2

Some works have also stressed out the relationship between gluconeogenesis and fatty acid oxidation.

The membrane bound long-chain acylcarnitine transferases, also known as carnitine palmitoyltransferase (CPT), are widely represented in organs and subcellular organelles (Bieber, L.L. 1988 Ann. Rev. Biochem. 57: 261-83). The well-established role of this category of enzymes is the transport of activated long-chain fatty acids through mitochondrial membranes. In this context, the outer mitochondrial membrane CPT I catalyzes the formation of long-chain acylcarnitines that are transported across the mitochondrial membrane by a specific carrier, and reconverted into long-chain acyl-coenzyme A esters by CPT II, which resides in the inner mitochondrial membrane. Long-chain acyl-CoAs are then oxidised to acetyl-coenzyme A, which activates a key gluconeogenetic enzyme: pyruvate carboxylase.

Other works report that diabetic patients have high blood levels of fatty acids, whose liver oxidative fate gives rise to an increase of acetyl-coenzyme A, ATP and NADH. High availability of these compounds maximally stimulates gluconeogenesis, which is in part responsible of the elevated glucose blood levels in diabetic patients. CPT inhibition indirectly reduces the extent of liver gluconeogenesis, and hence blood glucose levels.

CPT inhibitors have been disclosed in J. Med. Chem., 1995, 38(18), 3448-50 and in the corresponding European patent

3

./.

application EP 0 574 355 as potential derivatives with hypoglycaemic activity.

Aminocarnitines N-acylated with -COR residue, wherein R is an aliphatic residue with 1 to 19 carbon atoms are disclosed in WO85/04396 useful for investigating the role of transferases in the body, in particular the specificity of carnitine acyltransferase.

Emeriamine and its analogues are disclosed in EP 0 127 098 and J.Med. Chem. 1987, 30, 1458-1463.

Notwithstanding the mechanism of activity above outlined, to date, drugs inhibiting CPT capable to effectively counteract hyperglycaemia do not exist. For some products, such as tetradecyl glycidic acid, or etomoxir, myocardial hypertrophy have been evidenced as side effects (Life Sci., 1989, 44, 1897-1906).

None of the therapies presently used in clinic is fully satisfying, in particular due to the onset of unwanted side effects, such as severe hypoglycaemia, allergic phenomena, oedema, diarrhoea, intestinal disturbances, kidney toxicity, etc.

The necessity to obtain alternative effective therapies for hyperglycaemia still remains.

20 Abstract of the invention

It has now surprisingly been found that compounds of general formula (I):

4

./.

00573330-100000

1,40

wherein: X^+ is selected from the group consisting of $N^+(R_1, R_2, R_3)$ and $P^+(R_1, R_2, R_3)$, wherein

(R_1, R_2, R_3), being the same or different, are selected in the
 5 group consisting of hydrogen and C_1 - C_9 straight or branched alkyl groups, $-CH=NH(NH_2)$, $-NH_2$, $-OH$; or two or more R_1 , R_2 and R_3 , together with the nitrogen atom, which they are linked to, form a saturated or unsaturated, monocyclic or bicyclic heterocyclic system; with the proviso that at least one of the R_1 , R_2 and R_3 is
 10 different from hydrogen;

Z is selected from

$-OR_4$,

$-OCOOR_4$,

$-OCONHR_4$,

15 $-OCSNHR_4$,

$-OCSOR_4$,

$-NHR_4$,

$-NHCOR_4$,

$-NHCSR_4$,

20 $-NHCOOR_4$,

$-NHCSOR_4$,

$-NHCONHR_4$,

$-NHCSNHR_4$,

$-NHSOR_4$,

5

2

./.

-NHSONHR₄,

-NH₂SO₂R₄,

-NH₂SO₂NHR₄,

-SR₄,

5 wherein -R₄ is a C₁-C₂₀ saturated or unsaturated, straight or branched alkyl group, optionally substituted with a A₁ group, wherein A₁ is selected from the group consisting of halogen atom, C₆-C₁₄ aryl, heteroaryl, aryloxy or heteroaryloxy group, said aryl, heteroaryl, aryloxy or heteroaryloxy groups being optionally
10 substituted with one or more C₁-C₂₀ saturated or unsaturated, straight or branched alkyl or alkoxy group and/or halogen atom;

Y⁻ is selected from the group consisting of -COO⁻, PO₃H⁻, -OPO₃H⁻, tetrazolate-5-yl;

with the proviso that when Z is -NHCOR₄, X⁺ is
15 trimethylammonium, Y is -COO⁻, then R₄ is C₂₀ alkyl;

with the proviso that when Z is -NH₂SO₂R₄, X⁺ is trimethylammonium and Y⁻ is -COO⁻, then R₄ is not tolyl;

with the proviso that when Z is -NHR₄, X⁺ is trimethylammonium and Y⁻ is -COO⁻, then R₄ is not C₁-C₆ alkyl.

20 The present invention further comprises the use of the compounds of the above-mentioned formula (I) as active ingredients for medicaments, in particular for medicaments useful for the treatment of pathologies related to a hyperactivity of carnitine palmitoyl carnitine, such as and in particular hyperglycemic states,

6

2 ./.

0067230-10000
000004-000000

diabetes and related pathologies, congestive heart failure and dilatative cardiopathy.

The present invention comprises pharmaceutical compositions containing compounds of formula (I) as active ingredients, in admixture with pharmaceutically acceptable vehicles and excipients.

The present invention comprises also processes for the preparation of compounds of formula (I).

Detailed description of the invention

Within the scope of the present invention, as examples of C₁-C₂₀ linear or branched alkyl group, methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, nonyl, decyl, undecyl, dodecyl, tridecyl, tetradecyl, pentadecyl, hexadecyl, heptadecyl, octadecyl, nonadecyl and eicosyl and their possible isomers are meant, such as for example isopropyl, isobutyl, tert-butyl.

Examples of C₁-C₂₀ linear or branched alkenyl group are methylene, ethylidene, vinyl, allyl, propargyl, butylene, pentylene, wherein the carbon-carbon double bond, optionally in the presence of other carbon-carbon unsaturations, can be situated in the different possible positions of the alkyl chain, which can also be branched within the allowed isomery.

Examples of (C₆-C₁₄) aryl group are phenyl, 1- or 2-naphthyl, anthryl, optionally substituted as shown in the general definitions above-mentioned.

7

2

./.

Examples of heterocyclic groups thienyl, quinolyl, pyridyl, N-methylpiperidiny, 5-tetrazolyl, optionally substituted as shown in the general definitions above-mentioned.

As halogen atom it is intended fluorine, chlorine, bromine,
5 iodine.

The compounds of formula (I) can be also in the form of inner salts.

A first group of preferred compounds comprises the compounds of formula (I) wherein $N^+(R_1, R_2, R_3)$ is trimethyl
10 ammonium.

A second group of preferred compounds comprises the compounds of formula (I) wherein two or more R_1 , R_2 and R_3 , together with the nitrogen atom, which they are linked to, form a saturated or unsaturated, monocyclic or bicyclic heterocyclic system; for example
15 morpholinium, pyridinium, pyrrolidinium, quinolinium, quinuclidinium.

A third group of preferred compounds comprises the compounds of formula (I) wherein R_1 and R_2 are hydrogen and R_3 is selected from the group consisting of $-CH=NH(NH_2)$, $-NH_2$ and $-OH$.

20 Within the different embodiments of the present invention, the R_4 group is preferably a C_7 - C_{20} saturated or unsaturated, straight or branched alkyl group. In fact, it has been observed the length of the alkyl chain R_4 significantly increases the selectivity against CPT. Preferred R_4 groups are selected from the group consisting of heptyl,

8

2

./.

octyl, nonyl, decyl, undecyl, dodecyl, tridecyl, tetradecyl, pentadecyl, hexadecyl, heptadecyl, octadecyl, nonadecyl and eicosyl.

Preferred examples of Z group are ureido (-NHCONHR₄), and carbamate (-NHCOOR₄, -OCONHR₄) ones.

5 In particular, compounds of formula (I) wherein X⁺, R₁, R₂, R₃, have the above disclosed meanings, Z is ureido (-NHCONHR₄) or carbamate (-NHCOOR₄, -OCONHR₄), R₄ is a C₇-C₂₀, preferably a C₉-C₁₈ saturated or unsaturated, straight or branched alkyl group, are preferred.

10 The compounds of formula (I) have an asymmetry center on carbon atom bound to a Z group. For the purposes of the present invention, each compound of formula (I) can exist both as R,S racemic mixture and as separated R/S isomeric form.

00577329 100200
15 The compounds of formula (I) are quaternary ammonium or phosphonium derivatives always containing a Y⁻ anionic group. Dependently on pH, each compounds of formula (I) can exist indifferently as amphoteric (inner salt) or as a compound wherein Y⁻ is present in the YH form. In such a case, X⁺ is salified with a pharmacologically acceptable acid. Formula (I) covers all these
20 different possibilities. In case of nitrogen atoms having basic character, the salts with pharmaceutically acceptable acids, both inorganic and organic, such as for example, hydrochloric acid, sulfuric acid, acetic acid, or, in the case of acid group, such as carboxyl, the salts with pharmaceutically acceptable bases, both

9
./.

inorganic and organic, such as for example, alkaline and alkaline-earth hydroxides, ammonium hydroxide, amine, also heterocyclic ones. Examples of pharmaceutically acceptable salts are chloride; bromide; iodide; aspartate; acid aspartate; citrate; acid citrate; tartrate; acid tartrate; phosphate, acid phosphate; fumarate; acid fumarate; glycerophosphate; glucosephosphate; lactate; maleate; acid maleate; mucate; orotate; oxalate; acid oxalate; sulfate; acid sulfate; trichloroacetate; trifluoroacetate; methanesulfonate; pamoate and acid pamoate.

A first group of particularly preferred compounds comprises:

R,S-4-trimethylammonium-3-(nonylcarbamoyl)-aminobutyrate;

R,S-4-quinuclidinium-3-(tetradecyloxycarbonyl)-oxybutyrate;

R,S-4-trimethylammonium-3-(nonylcarbamoyl)-oxybutyrate;

R,S-4-trimethylammonium-3-(nonyloxycarbonyl)-oxybutyric acid chloride;

R,S-4-trimethylphosphonium-3-(nonylcarbamoyl)-oxybutyrate;

R,S-4-trimethylammonium-3-(octyloxycarbonyl)-aminobutyrate;

R,S-4-trimethylammonium-3-(nonyloxycarbonyl)-aminobutyrate;

R,S-4-trimethylammonium-3-octyloxybutyrate;

R,S-4-trimethylammonium-3-tetradecyloxybutyrate;

R,S-1-guanidinium-2-tetradecyloxy-3-(tetrazolate-5-yl)-propane;

R,S-1-trimethylammonium-2-tetradecyloxy-3-(tetrazolate-5-yl)-propane;

R,S-3-quinuclidinium-2-(tetradecyloxycarbonyl)-oxy-1-propanephosphonate monobasic;

R,S-3-trimethylammonium-2-(nonylaminocarbonyl)-oxy-1-propanephosphonate monobasic;

- 5 R,S-3-pyridinium-2-(nonylaminocarbonyl)-oxy-1-propanephosphonic acid chloride;

R-4-trimethylammonium-3-(tetradecylcarbamoyl)-aminobutyrate;

R-4-trimethylammonium-3-(undecylcarbamoyl)-aminobutyrate;

R-4-trimethylammonium-3-(heptylcarbamoyl)-aminobutyrate;

- 10 R,S-4-trimethylammonium-3-(nonylthiocarbamoyl)-aminobutyrate;

R-4-trimethylammonium-3-(nonylcarbamoyl)-aminobutyrate;

S-4-trimethylammonium-3-(nonylcarbamoyl)-aminobutyrate;

S-4-trimethylammonium-3-(tetradecylcarbamoyl)-aminobutyrate;

R,S-4-trimethylammonium-3-tetradecylaminobutyrate;

- 15 R,S-4-trimethylammonium-3-octylaminobutyrate;

R,S-4-trimethylammonium-3-(decansulfonyl)aminobutyrate;

R,S-4-trimethylammonium-3-(nonylsulfamoyl)aminobutyrate;

S-4-trimethylammonium-3-(dodecansulfonyl)aminobutyrate;

R-4-trimethylammonium-3-(dodecansulfonyl)aminobutyrate;

- 20 S-4-trimethylammonium-3-(undecylsulfamoyl)aminobutyrate;

R-4-trimethylammonium-3-(undecylsulfamoyl)aminobutyrate;

R-4-trimethylammonium-3-(dodecylcarbamoyl)aminobutyrate;

R-4-trimethylammonium-3-(10-

phenoxydecylcarbamoyl)aminobutyrate;

// ./. 2

0057739-10500

R-4-trimethylammonium-3-(*trans*- β -styrenesulfonyl)aminobutyrate.

The compounds of formula (I) can be prepared with reactions that are well known in the state of the art.

A process for the preparation of the compounds of claim 1, wherein
 5 Z is $-\text{NHR}_4$ comprising the reaction of $\text{X}^+-\text{CH}_2-\text{CH}(\text{NH}_2)-\text{CH}_2-\text{Y}^-$, wherein X^+ and Y^- have the same meanings as in claim 1, of the desired structure, optionally protected on the acid Y^- group, with alkane carbaldehydes, wherein the alkyl moiety is a one-term lower homologue of the desired R_4 , and subsequent reduction.

10 Generally, the compounds of formula (I), wherein Z is carbonate ($-\text{OCOOR}_4$), carbamate ($-\text{OCONHR}_4$, $-\text{NHCOOR}_4$), thiocarbamate ($-\text{OCSNHR}_4$, $-\text{NHCSOR}_4$,) or thiocarbonate ($-\text{OCSOR}_4$), are obtained by reacting a compound of formula $\text{X}^+-\text{CH}_2-\text{CH}(\text{OH})-\text{CH}_2-\text{Y}^-$, wherein X^+ and Y^- are as above defined, of the desired
 15 structure, optionally protected on the acid Y^- group, respectively with alkyl chloroformates, alkyl isocyanates, alkyl isothiocyanates, alkyl thiochloroformates, containing the desired R_4 alkyl group.

Compounds of formula (I), wherein Z is amide ($-\text{NHCOR}_4$), thioamide ($-\text{NHCSR}_4$), carbamate ($-\text{NHCOOR}_4$, $-\text{OCONHR}_4$),
 20 thiocarbamate ($-\text{NHCSOR}_4$, $-\text{OCSNHR}_4$), ureido ($-\text{NHCONHR}_4$), thioureido ($-\text{NHCSNHR}_4$), sulfinamide ($-\text{NHSOR}_4$), sulfonamide ($-\text{NHSO}_2\text{R}_4$), sulfinamoylamino ($-\text{NHSONHR}_4$), and sulfamide ($-\text{NHSO}_2\text{NHR}_4$), are obtained by reacting $\text{X}^+-\text{CH}_2-\text{CH}(\text{NH}_2)-\text{CH}_2-\text{Y}^-$, wherein X^+ and Y^- are as above defined, of the desired structure,

12

2

./.

optionally protected on the acid Y^- group, respectively with acyl chlorides, thioacyl chlorides, alkyl chloroformates, alkyl thiochloroformates, alkyl isocyanates, alkyl thioisocyanates, alkyl sulfinyl chlorides, alkyl sulfonyl chlorides, $SOCl_2$ and alkyl amines, alkyl sulfamoyl chlorides (or SO_2Cl_2 and alkyl amines), containing the desired R_4 alkyl group.

Compounds of formula (I), wherein Z is $-OR_4$ or $-SR_4$ are obtained by the reaction of carbonyl compounds of formula $Hal-CH_2-CO-CH_2-COOR'$, wherein Hal is a halogen atom, preferably chlorine, and R' is the residue of a suitable ester, such as for example a lower alkyl ester (an ethyl or a tert-butyl ester) with respectively alcohols and thiols R_4OH or R_4SH , wherein R_4 is as above defined, to give the respective ketal or thioketal, followed by the transformation of the respective ketal or thioketal into the respective ether or thioether, subsequent substitution of the Hal atom with a nucleophilic group, such as azido, phthalimido, nitro, amino, alkyl amino group, and transformation of the nucleophilic group into the X^+ group, wherein X^+ is $N^+(R_1, R_2, R_3)$ or, alternatively the Hal atom is substituted with a (R_1, R_2, R_3) -substituted phosphine to obtain the compounds of formula (I) wherein X^+ is $P^+(R_1, R_2, R_3)$.

Compounds of formula (I), wherein Z is $-NHR_4$ are obtained by reacting $X^+-CH_2-CH(NH_2)-CH_2-Y^-$, wherein X^+ and Y^- have the same meanings as in claim 1, of the desired structure, optionally protected on the acid Y^- group, with alkane carbaldheydes, wherein the alkyl

13

./.

moiety is a one-term lower homologue of R_4 , and subsequent reduction.

Regarding the various meanings of R_4 , present in the different reactives, these reactives are available in the market, or can be prepared according to well-known methods in literature, which the experts in the field can resort to, completing with their own knowledge of the argument.

Pharmaceutically acceptable salts are obtained with conventional methods found in the literature, and do not necessitate of further disclosure.

The compounds disclosed in the present invention have reversible inhibiting activity of carnitine palmitoyl-transferase (CPT). This activity allows their use as active ingredients in the preparation of medicaments useful for the treatment and prevention of hyperglycaemia, diabetes and disorders related thereto, such as, for example diabetic retinopathy, diabetic neuropathy. The compounds of the present invention are also useful as active ingredient for the treatment and prevention of cardiovascular disorders, such as congestive heart failure. The compounds of formula (I) are also applicable for medicaments for the prevention and treatment of ketonic states, wherein it is intended the pathological conditions characterized by high levels of ketone bodies in blood.

Inhibiting activity mainly occurs on the isoform I of palmitoyl carnitine transferase (CPT-I).

14 ./.

006773229 400200

A further object of the present invention relates to pharmaceutical compositions comprising at least a compound of formula (I), in an amount such as to produce a significant therapeutical effect. The compositions according to the present invention are conventional and are obtained with commonly used methods in the pharmaceutical industry. According to the desired administration route, the compositions shall be in solid or liquid form, suitable to the oral, parenteral, intravenous or transdermal route. The compositions according to the present invention comprise together with the active ingredients at least a pharmaceutically acceptable vehicle or excipient. Formulation co-adjuvants, for example solubilizing, dispersing, suspending, emulsifying agents can be particularly useful. Examples of suitable oral pharmaceutical compositions are capsules, tablets, granulates, powders, syrups, elixirs. Examples of suitable parenteral pharmaceutical compositions are solutions, emulsions, suspensions. Examples of suitable transdermal pharmaceutical compositions are patches, subcutaneous implants.

The compounds of formula (I) can also be used in combination with other well-known active ingredients.

The dose of the active ingredients will vary depending on the kind of active ingredient used, the administration route, the grade of pathology to be treated and the general conditions of the subject. The dosage and posology shall be determined by the clinic expert or

15

the physician. Generally, a therapeutic effect can be obtained at dosages comprised between 1 and 100 mg/kg body weight.

The compounds according to the present invention are useful as medicaments with hypoglycaemic activity. A further object of the present invention is the preparation of a pharmaceutical composition comprising admixing at least a compound of formula (I) with suitable pharmaceutically acceptable excipients and/or vehicles.

The following examples further illustrate the invention.

EXAMPLE 1

**R,S-4-trimethylammonium-3-(nonylcarbamoyl)-aminobutyrate
(ST 1251)**

Nonyl isocyanate

A solution of decanoyl chloride (20 g, 104.8 mmoles) in acetone (30 ml) was dropped into a solution of sodium azide (9.53 g, 146.6 mmoles) in water (30 ml), cooled in an ice bath. The temperature of the azide solution was kept between 10 and 15°C. after one hour, the solution was transferred in a separatory funnel and the lower phase (the aqueous one) was eliminated. The higher phase was transferred into a flask containing 100 ml of toluene, previously warmed at 65°C. After 1.5 hours, the solution was evaporated to dryness, giving 13.37 g crude product, which after vacuum distillation gave 8.3 g pure product in the form of colourless liquid.

Yield 47%.

16

2 ./.

$^1\text{H-NMR}$ (300 MHz; CDCl_3):

δ : 3.3 (t, 2H), 1.6 (m, 2H), 1.45-1.2 (m, 12H), 0.9 (brt, 3H).

R,S-4-trimethylammonium-3-(nonylcarbamoyl)-aminobutyrate

Nonyl isocyanate (15.42 g, 91.12 mmol) was added to a solution of aminocarnitine, inner salt (7.3 g, 45.56 mmol) in anhydrous DMSO (350 ml) and the solution was left to stand for 60 hours at 40°C. The resulting mixture was transferred in a 3 l Erlenmeyer flask, containing ethyl ether (2.5 l) and the solvent was separated by decanting the formed precipitate, which was then transferred into a flask and precipitated again with ethyl ether. The so obtained crude product was washed several times with ethyl ether and purified on a silica gel chromatographic column, using a CHCl_3 : MeOH 9:1 to CHCl_3 : MeOH 3:7 gradient until elution of impurities with higher R_f , then eluting the product of interest with MeOH only. 9.7 g of pure product were obtained.

Yield 68%.

M.p.: 145-147°C.

$^1\text{H-NMR}$ (300 MHz; D_2O):

δ : 4.4 (m, 1H), 3.45 (dd, 1H), 3.30 (d, 1H), 3.05 (s, 9H), 2.9 (t, 2H), 2.3 (d, 2H), 1.3 (m, 2H), 1.15 (brs, 12H), 0.8 (brt, 3H).

EXAMPLE 2

**R,S-4-quinuclidinium-3-(tetradecyloxycarbonyl)-oxybutyrate (ST
1265)**

10 ter-Butyl R,S-4-quinuclidinium-3-hydroxybutyrate iodide

Quinuclidine (2.40 g, 21.60 mmoles) was added to ter-Butyl
R,S-4-iodo-3-hydroxybutyrate (6.18 g, 21.60mmoles) in acetonitrile
(60ml) and the solution was warmed to 60°C for 20 hours under
stirring. After evaporation of the solvent, the residue was dissolved
15 in acetonitrile and precipitated with ethyl ether several times to give
7.2 g of product, contaminated with about 13% by weight of
quinuclidine iodide (as from NMR). After repeated crystallization
from CH₃CN/Et₂O, 4.3 g of pure product were obtained.

Yield 50%.

20 M.p.: 124-127°C.

¹H-NMR (300 MHz; D₂O):

δ : 4.50 (m, 1H), 3.40 (m, 2H), 2.42 (m, 2H), 2.08 (m, 1H), 1.88

FAB Mass=270, [M⁺].

18

Elemental analysis: responding to the expected formula

$C_{15}H_{28}INO_3$.

K.F.=0.5% water.

The preparation of ter-butyl 4-iodo-3-hydroxybutyrate was carried
out as described in J. Pharm. Science 64/7, 1262-1264, 1975.

Tetradecyl chloroformate

29 ml of a 20% toluene solution of phosgene (55.98 mmoles)
was added to tetradecyl alcohol (4 g, 18.66 mmoles) and the reaction
mixture was left to stand for 20 hours under stirring at room
temperature. After solvent evaporation, the residue was taken up
with hexane and evaporated to dryness (several times) to give 5.1 g
product as colourless liquid.

Yield 98%.

1H -NMR (300 MHz; $CDCl_3$):

δ : 4.30 (t, 2H), 1.72 (m, 2H), 1.30 (m, 22H), 0.85 (brt, 3H).

ter-butyl R,S-4-quinuclidinium-3-(tetradecyloxycarbonyl)-oxy
butyrate chloride

Dimethylaminopyridine (922 mg, 7.55 mmoles) and tetradecyl
chloroformate (2.09 g, 7.55 mmoles) were added to ter-butyl R,S-4-
quinuclidinium-3-hydroxybutyrate (2 g, 5.03 mmoles) in anhydrous
 CH_2Cl_2 (20ml). The solution was left to stand at room temperature
for 20 hours under stirring. After this time, the solution was diluted
with $CHCl_3$, saturated with NaCl, and dried over anhydrous sodium
sulfate. The dry residue obtained after evaporation was taken up

19

./.

with ethyl ether and the undissolved residue was filtered off. After solvent evaporation a crude product was obtained. Flash-chromatography (CHCl_3 : MeOH 9:1) and elution with MeOH on Amberlyst A-21 resin (activated in HCl from), gave 1.6 g product as
 5 chloride.

Yield 58%.

M.p.: 59-60°C.

^1H -NMR (300 MHz; CDCl_3):

δ : 5.50 (m, 1H), 4.55 (d, 2H), 3.80 (m, 7H), 2.90 (dd, 1H), 2.75
 10 (dd, 1H), 2.22 (m, 1H), 2.05 (d, 6H), 1.65 (m, 2H), 1.41 (s, 9H), 1.25
 (m, 22H), 0.85 (brt, 3H).

FAB Mass=510, $[\text{M}^+]$.

Elemental analysis: responding to the expected formula

$\text{C}_{30}\text{H}_{56}\text{ClNO}_5$.

15 K.F.=1.5% water.

R,S-4-quinuclidinium-3-(tetradecyloxycarbonyl)-oxybutyrate

Trifluoroacetic acid (6 ml) was added to ter-butyl R,S-4-quinuclidinium-3-(tetradecyloxycarbonyl)-oxybutyrate chloride (1.05 g, 1.92 mmoles) and the solution was left to stand for 1 hour at
 20 room temperature under stirring. After vacuum-evaporation of trifluoroacetic acid, the residue was taken up with cyclohexane and evaporated to dryness several times, then transferred on an Amberlyst IRA 402 resin (Cl^- form) and eluted with water. The crude product, obtained by freeze-drying was purified through silica gel

Yield 55%.

M.p.: 132-134°C.

¹H-NMR (300 MHz; D₂O):

EXAMPLE 3

R,S-4-trimethylammonium-3-(nonylcarbamoyl)-oxybutyrate (ST
20 1298)

Benzyl ester of R,S-4-trimethylammonium-3-
(nonylcarbamoyl)-oxybutyric acid perchlorate

Nonyl isocyanate (7.39 g, 43.36 mmoles) was added to a solution of R,S-carnitine perchlorate, benzyl ester (7.69 g, 21.86

mmoles) in toluene (100 ml) and the solution was refluxed for 5 days under stirring. Nonyl isocyanate (1.84 g, 10.86 mmoles) was further added and the reaction mixture was left under reflux for other 5 days. The solvent was vacuum-evaporated and the residue was washed with ethyl ether and subsequently taken up with chloroform, washed with water and dried over anhydrous sodium sulfate. The oil resulting from the evaporation of the organic phase was purified through flash-chromatography column, using a gradient CHCl_3 to CHCl_3 : MeOH 95:5. 4.4 g product were obtained in the form of a thick oil.

Yield 38.6%.

^1H -NMR (200 MHz; CDCl_3):

δ : 7.3 (s, 5H), 5.4 (m, 2H), 5.05 (m, 2H), 3.8 (dd, 1H), 3.55 (d, 1H), 3.15 (s, 9H), 3.05 (m, 2H), 2.75 (m, 2H), 1.4 (m, 2H), 1.2 (brs, 12H), 0.8 (brt, 3H).

EXAMPLE 4

R,S-4-trimethylammonium-3-(nonyloxycarbonyl)-oxybutyrate chloride (ST 1297)

Benzyl ester of R,S-4-trimethylammonium-3-(nonylcarbamoyl)-oxybutyric acid chloride

Dimethylaminopyridine (3.8 g, 31.2 mmoles) and nonyl chloroformate (6.45 g, 31.2 mmoles) were added to R,S-carnitine

perchlorate, benzyl ester (7.33 g, 20.8 mmoles) in anhydrous DMF (50ml) at 0°C. The temperature was left to raise to room temperature and the reaction mixture was left to stand for 3 days under stirring. CHCl₃ was added and the solution was washed with 1N perchloric acid. The organic phase was dried over anhydrous sodium sulfate and evaporated to dryness, to give 6.02 g crude product, which was purified through flash-chromatography (CHCl₃: MeOH 85:15). 3.52 g a thick oil were obtained, which were subsequently dissolved in MeOH and passed through an Amberlyst A-21 resin (activated in HCl from), eluting with MeOH. After vacuum-evaporation of the solvent, 3.1 g oily product were obtained.

Yield 32.4%.

¹H-NMR (200 MHz; CDCl₃):

δ: 7.3 (s, 5H), 5.45 (m, 1H), 5.05 (s, 2H), 4.4 (d, 1H), 4.1 (t, 2H), 3.8 (dd, 1H), 3.4 (s, 9H), 2.9 (m, 2H), 1.55 (m, 2H), 1.2 (brs, 12H), 0.8 (brt, 3H).

Mutatis mutandis, the preparation of nonyl chloroformate was carried out as disclosed in Example 2 for tetradecyl chloroformate.

R,S-4-trimethylammonium-3-(nonyloxycarbonyl)-oxybutyric acid chloride

10% Pd/C (110 mg) was added to benzyl R,S-4-trimethylammonium-3-(nonyloxycarbonyl)-oxybutyric acid chloride (1.1 g, 2.4 mmoles) in MeOH (10 ml) and the mixture was hydrogenated at 47 psi for 2 hours. After filtration on celite, the

24

./.

solution was vacuum-dried giving 883 mg product (yield 100%), which was further purified by precipitation from CH₃CN/Et₂O. 600 g of product were obtained.

Yield: 68%.

EXAMPLE 5

R,S-4-trimethylphosphonium-3-(nonylcarbamoyl)-oxybutyrate

20 **(ST 1300)**

Ethyl ester of R,S-4-trimethylphosphonium-3-hydroxybutyric acid iodide

A 1M solution of trimethylphosphine in THF (93 ml) was added to ethyl R,S-4-iodo-3-hydroxybutyrate (20 g, 77.5 mmol) and the

25

./.

reaction mixture was left to stand at room temperature for 5 days under stirring. Ethyl ether was added, and the precipitate formed was separated by decantation. The precipitate was triturated with Et₂O and dried under vacuum, giving 18.5 g product.

Yield 71.3%.

M.p.: 105-107°C.

¹H-NMR (200 MHz; CDCl₃):

δ: 4.6 (m, 1H), 4.15 (q, 2H), 3.1 (m, 1H), 2.75 (m, 3H), 2.2 (d, 9H), 1.3 (t, 3H).

The ethyl ester of R,S-4-trimethylphosphonium-3-hydroxybutyric acid was prepared as described in Tetrahedron 1990, 4277-4282, starting from R,S-3-hydroxy-4-butyrolactone.

Ethyl ester of R,S-4-trimethylphosphonium-3-(nonylcarbamoyl)-oxybutyric acid iodide

Nonyl isocyanate (4.04 g, 23.86 mmoles) was added to the ethyl ester of R,S-4-trimethylphosphonium-3-hydroxybutyric acid iodide (4 g, 11.97 mmoles) in anhydrous DMF (80 ml) and the solution was left to stand for 7 days at 110°C under stirring. CHCl₃ was added (300 ml) and the solution was washed with water and dried over Na₂SO₄. The residue obtained after evaporation of the solvent was taken up with acetonitrile, the formed solid was filtered off and the filtrate was purified by silica gel flash-chromatography, using CHCl₃: MeOH 8:2. 2.07 g of product in the form of a thick oil were obtained.

26

./.

Yield 34.3%.

$^1\text{H-NMR}$ (200 MHz; CDCl_3):

Elemental analysis: responding to the expected formula
 $C_{14}H_{27}N_3O_3$

Step D

The product obtained in the preceding step C (15.39 g, 0.054
5 moles) was dissolved in 31 ml of acetic acid and the resulting
solution was subjected to catalytic hydrogenation with 10% Pd/C at
60 psi for 7 hours. The reaction progress was checked by TLC, until
disappearance of the starting product (hexane/ethyl ether 95:5).
Thereafter, formaldehyde was added (4.6 ml, 0.167 moles) followed
10 by 10% Pd/C and the mixture was hydrogenated at 30 psi for 2
days. The catalyst was filtered off and the mixture was vacuum-
dried. A pale yellow liquid was obtained, which was taken up with
methylene chloride, washed with 1N NaOH, then water, then NaCl
saturated solution; the organic phase was dried over anhydrous
15 sodium sulfate, filtered and vacuum-evaporated to dryness. A thick
oil was obtained. The product was obtained with a 98% yield.

10 **Example 12**

R,S-3-quinuclidinium-2-(tetradecyloxycarbonyl)-oxy-1-propanephosphonate monobasic (ST 1260)

Step A

In anhydrous environment, -70°C, a hexane solution of 1.6 M
 15 BuLi (14 ml, 0.022 moles) was dropped into a solution of dibenzyl phosphite (5.8 g, 0.022 mmoles) in THF. After 15 minutes, 1.8 ml (0.022 moles) of epibromhydrine, dissolved in 5 ml THF, were added. After the addition, etherated BF_3 (3.6 ml, 0.022 moles) was dropped very slowly. The reaction was left for further 3 hours at -70°C. A
 20 saturated ammonium chloride solution was added; then the temperature was left to raise to room temperature. This solution was extracted several times with AcOEt and the gathered organic phases were treated with saturated $NaHCO_3$, and dried over anhydrous sodium sulfate, filtered and vacuum concentrated. An oil was

48

./.

obtained, which after purification on silica gel chromatography (AcOEt/Hexane 1:1); gave 1.1 g of unreacted dibenzylphosphite and 5.3 g of product of interest.

Yield=60%.

5 TLC silica gel AcOEt/Hexane 7:3;

R_f=0.54.

¹H-NMR (300 MHz; CD₃OD):

Step F

The compound obtained in the preceding step (5.68 g, 10 mmoles) was dissolved in DMF (11 ml), together with TBAI (tetrabutyl ammonium iodide) in catalytic amounts (1% w/w with respect to the substrate). This solution was saturated with gaseous trimethylamine. The reaction was carried out at 50°C , until the starting compound disappeared. At the end of the reaction, the solution was high vacuum-concentrated, obtaining a semisolid, 10 containing the product. The latter was isolated and purified through silica gel flash-chromatography using a gradient from CH_2Cl_2 only to CH_2Cl_2 :MeOH 1.1. The product was obtained.

Yield: 25%.

phenoxydecylcarbamoyl)aminobutyrate (ST 1449)**

10-Phenoxydecyl isocyanate

mmoles) in acetone (30 ml) was dropped into a solution of sodium
azide (9.53 g, 146.6 mmoles) in water (30 ml), cooled in an ice bath,
keeping the solution temperature between 10 and 15°C. After one
hour, the solution was transferred in a separatory funnel and the
lower phase (the aqueous one) was eliminated. The higher phase was
transferred into a flask containing 100 ml of toluene, previously
warmed at 65°C. After 1.5 hours, the solution was evaporated to
dryness, giving 13.37 g of crude product, which could be used as
such in the subsequent reaction.

R-4-trimethylammonium-3-(10-phenoxydecylcarbamoyl)-amino
butyrate

10-phenoxydecylisocyanate (25.0 g, 91.12 mmol) was added
to a solution of aminocarnitine, inner salt (7.3 g, 45.56 mmol) in
anhydrous DMSO (350 ml) and the solution was left to stand for 60
hours at 40°C. The resulting mixture was transferred in a 3 l
Erlenmeyer flask containing ethyl ether (2.5 l) and the solvent was
separated by decantation of the formed precipitate, which was then
taken with few chloroform, transferred into a flask and precipitated
again with ethyl ether. The so obtained crude product was washed
several times with ethyl ether and purified on a silica gel
chromatographic column, using a gradient CHCl₃: MeOH 9:1 to
CHCl₃: MeOH 3:7 gradient until elution of impurities with higher R_f,
then eluting the product of interest with MeOH only. 13.5 g of pure
product were obtained.

PHARMACOLOGICAL ACTIVITY

Determination of CPT inhibiting activity.

CPT inhibition was evaluated essentially as described in Kerner, J. & Bieber, L.L. (1990) Biochemistry 29: 4326-34 on fresh

78

./.

mitochondrial preparations obtained from normally fed Fischer rat liver or heart. Mitochondria were isolated from liver or heart and suspended in 75 mM saccharose buffer, 1 mM EGTA, pH 7.5. 100 μ l mitochondrial suspension, containing 50 μ M [14 C] palmitoyl-CoA (specific activity 10,000 DPM/mole) and 10 mM L-carnitine, were incubated at 37°C, in the presence of scalar concentrations of the test product (0-3 mM). Reaction time: 1 minute.

Table 1 shows the IC₅₀ determined.

The compounds of the present invention have higher inhibiting activity than the one of the reference compound SDZ-CPI-975, Example 1, disclosed in EP 0 574 355.

TABLE 1

IC₅₀ of inhibition CPT1 curve in rat liver mitochondria

Compound	IC ₅₀ (μ M/I)

Determination of oleate-stimulated β -hydroxybutyrate production

β -hydroxybutyrate production is an index of CPT activity. In fact, the production of ketone bodies, final products of mitochondrial β -oxidation, is related to CPT activity.

79

./.

Mitochondrial preparations, obtained according to the method by Venerando et al. (Am. J. Physiol. 266:C455-C461, 1994), were used. Hepatocytes are incubated at 37°C in KRB bicarbonate buffer at pH 7.4, 6 mM glucose, 1% BSA in O₂/CO₂ 95/5 atmosphere at 2.5x10⁶ cells/ml. After 40 min incubation with the test compound at different concentrations, the first set of samples was taken (T₀ min) and oleate was added (1 mM final in KRB+BSA 1.4%). After 20 minutes, the second withdrawal was made (T₂₀ min).

Table 2 shows the results. The data are the mean of three different experiments, twice carried out.

The compounds of the present invention have higher β -hydroxybutyrate inhibiting activity than the one of the reference compound SDZ-CPI-975, Example 1, disclosed in EP 0 574 355.

Glucose and β -hydroxybutyrate in serum fasted rats treated with CPT inhibitors

Normally fed Fischer rats were starved for 24 hours and subsequently treated with the test compounds. One hour after the treatment, the animals were sacrificed and serum concentrations of glucose and β -hydroxybutyrate were determined.

Table 3 shows the results. For the compound ST1326 were used doses of 14.5 mg/2 ml/kg, for other test compounds, the doses are equivalent to ST1326 one.

TABLE 3

β -hydroxybutyrate and glucose serum concentration in 24 hours-starved rats, after one hour from intraperitoneal treatment.

Glucose and insulin levels in diabetic animals treated with CPT inhibitors

C57BL/6J male rats, 5-weeks old, were provided by Ch. River. After 10 days of acclimatisation in standard conditions (22 ± 2 °C; $55 \pm 15\%$ humidity; 15 - 20/h air changes; 12 hours light-dark cycle, with 700 - 1900 lux) and with standard diet with 4RF21 feedstock (Mucedola), glycaemia was controlled in post-absorption state (starving from 8.30 a.m. to 4.30 p.m.). Blood withdrawal was carried out cutting the tail end. Glucose was analysed in blood acid supernatant (HClO₄ 0,375 N) with autoanalyzer Cobas Mira S with Glucose GDH Kit (Roche).

The animals were divided in two groups, 26 mice each and fed with a high-fat and a low-fat diet, respectively.

After 2 months from the start of the diet, glycaemia was tested, according to the starting method. After about 3 months from the start of the diet, glycaemia was tested, according to the starting method and plasma insulin levels were also determined (with blood withdrawal from end tail cutting) using [125I] Rat Insulin Kit (Amersham).

One 10 mice group fed with low-fat diet and two 10-mice groups fed with high -fat diet were selected One of the two high fat diet was administered with ST 1327 at the dose of 45 mg/Kg in deionised H₂O (p.o., twice a day, 8.30 a.m. and 5.30 p.m.).administration volume was 10 ml/Kg. the two remaining

82

./.

groups was treated with vehicle only. High-fat or low-fat diets were continued during the treatment.

After 20 days of treatment, glycaemia and plasma insulin were measured. After 43 days of treatment, the animals were sacrificed by decapitation in post-absorption state (fasting 8.30 a.m.-4.30 p.m.), 8 hours after the last treatment. Blood was withdrawn and serum was separated by centrifugation and stored at - 80 °C. Liver, heart and skeletal muscle (upper limbs) were also extracted, frozen in dry ice-acetone and kept at - 80 °C.

High-fat diet determined an increase of body weight, glycaemia and insulin, with respect to low-fat diet.

After 20 days of treatment with ST 1327, glucose and insulin levels significantly decreased.

Table 4 shows the results.

TABLE 4

Glucose and insulin levels in rats fed with fat-rich diet.

Compound	High Fat diet Control	High Fat diet Treated	Low fat diet Control
Glucose mg/dl	248.5±11.03 (10)	181.4±9.63* (9)	207.3±6.84** (9)
Insulin ng/ml	1.632±0.246 (10)	0.621±0.117** (9)	0.549±0.050* (9)

83

Student's t test, * and ** indicate $p < 0.001$ and $p < 0.01$, respectively, against high fat diet; () indicates the number of cases.

These results shows that the compounds according to the present invention are effective in controlling glycaemia in fasting conditions. This is an important aspect in the treatment of diabetes, wherein hepatic gluconeogenesis occurs during fasting periods (i.e. nocturnal rest).

The effect of CPT inhibitors on myocardial ischemia

The compounds of the present invention are also effective in the treatment of ischemia, in particular myocardial ischemia.

To this end, male Wistar rats, weighing 200-225 g, provided by Charles-River, were kept at constant temperature of $23^{\circ} \pm 1^{\circ}\text{C}$, $50 \pm 10\%$ relative humidity, 12 hours light-dark cycle, fed with pellet 4RF21 (Mucedola) tap water ad libitum.

The animals were anaesthetised with sodium Pentobarbital at the dose of 70 mg/Kg i.p.. Hearts were rapidly removed and put in a cold Krebs-Henseleit solution, before incannulation of aorta e subsequent perfusion according to Langendorff technique at 37°C with a pressure of 100 cm water.

Perfusion medium (Krebs-Henseleit) at pH 7.4 consists in: 128 mM NaCl, 4.7 mM KCl, 1 mM MgCl_2 , 0.4 mM Na_2HPO_4 , 20.2 mM NaHCO_3 , 1.3 mM CaCl_2 , 5 mM glucose. The medium was constantly oxygenated with carbogen (95% O_2 , 5% CO_2).

84

After a 10 min "conditioning" period, hearts were perfused in a recirculant apparatus for 20 min. with the same medium containing 0.6 mM palmitate complexed with albumine (fraction V, fatty acid free), with or without the CPT inhibitor according to the present invention. By way of example ST 1364 was used at concentrations of 1 and 5 μ M. After such a period ischemia was induced by reducing perfusion hydrostatic pressure from 100 cm to 20 cm for a period of 30 min.. Reperfusion was started re-establishing the starting pressure conditions (100 cm). Hearts were controlled for 20 min.. the inhibitor is present also during reperfusion phase.

Lactate dehydrogenases (LDH) release was monitored in the effluent in normal oxygenation conditions, during ischemia, with a withdrawal of medium at 30', and during reperfusion, with withdrawals at 1.5, 10, 15 and 20 minutes.

LDH release in the effluent is remarkably reduced, during reperfusion results significantly reduced in the presence of ST1364 at the dose of 5 μ M (fig. 1). This result indicates a lower entity of cellular damage from reperfusion of the treated with respect to the controls.

Statistical analysis was carried out with Student's "t" test for non-paired data.

The number of the cases for each group is six (n=6).

The following Table 5 reports the results.

TABLE 5

1,850

85

./.

LDH release in perfusate (mU/ml/min)

	Control	ST1364 1 μ M *	ST1364 5 μ M **
Basal	280	275	220
Ischemia 30'	200	220	200
Reperfusion 1'	640	480	410
Reperfusion 5'	660	500	380
Reperfusion 10'	670	495	380
Reperfusion 15'	700	510	320
Reperfusion 20'	720	580	325

Statistical analysis was carried out with Student's "t" test for non-paired data. * $p < 0.05$ vs controls; ** $p < 0.01$ vs controls.

The number of the cases for each group is six ($n=6$).

LDH release in the effluent is remarkably reduced, during reperfusion results significantly reduced in the presence of ST1364 at the dose of 5 μ M (fig. 1). This result indicates a lower entity of cellular damage from reperfusion of the treated with respect to the controls.

In another aspect, the present invention provides a combination of at least a compound of formula (I) with at least another active ingredient suitable for the treatment of the disease of interest.

In the treatment or prevention of diabetes, the present invention provides a compound of formula (I), optionally in combination with a suitable well-known active ingredient, such as for example a sulfonylurea, L-carnitine, fibrate and other agonists of

peroxisomal proliferator activated receptor (PPAR- α), agonists of 9-cis retinoic acid activated receptor, such as RXR, in particular α -, β - and γ -isoforms, HMG-CoA reductase inhibitor, β -sitosterol inhibitor, cholesterol acyltransferase inhibitor, biguanides, cholestyramine, angiotensin II antagonist, melinamide, nicotinic acid, fibrinogen receptor antagonists, aspirin, α -glucosidase inhibitors; insulin secretagogue, insulin and glucagon-like peptides (incretins) and agonists of PPAR- γ (such as thiazolidinediones or others).

In the treatment or prevention of obesity, the present invention provides a compound of formula (I), optionally in combination with an suitable well-known active ingredient, such as for example fenfluramine, dexfenfluramine, phentiramine, a β -3-adrenergic receptor agonist.

In the treatment or prevention of high triglyceridemia, the present invention provides a compound of formula (I), optionally in combination with an suitable well-known active ingredient.

The compounds according to the present invention are also useful in the treatment or prevention of high cholesterol levels and in modulating HDL plasma levels, thus resulting beneficial in the treatment or prevention of the diseases related with these altered plasma levels. Examples of related diseases are hypertension, obesity, atherosclerosis, diabetes and related conditions. The medicaments containing at least a compound of the present invention may contain in combination at least another active

ingredient effective in the treatment or prevention of the above mentioned diseases. Examples of other active ingredient are fibrates, such as clofibrate, bezafibrate and gemfibrozil and other PPAR- α agonists; inhibitors of cholesterol biosynthesis, such as HMG-CoA reductase inhibitors, such as statins, namely lovastatin, simvastatin and pravastatin; inhibitors of cholesterol absorption for example beta-sitosterol and (acyl CoA:cholesterol acyltransferase) inhibitors for example melinamide; anion exchange resins for example cholestyramine, colestipol or a dialkylaminoalkyl derivatives of a cross-linked dextran; nicotiny alcohol, nicotinic acid or a salt thereof; vitamin E; thyromimetics and L-carnitine.

The compounds of the present invention may be orally administered in the form of a pharmaceutical composition, comprising a therapeutically effective amount of at least a compound of formula (I) in admixture with a pharmaceutically acceptable vehicle and/or excipient. Examples of oral pharmaceutical compositions are hard or soft capsules, tablets, including sublingual administration, ampoules, sachets, elixirs, suspensions, syrups, and the like. Alternatively, the active ingredients according to the present invention may be incorporated directly with the food of the diet. The amount of active compound in such therapeutically useful compositions is such that an effective dosage will be obtained. The active compounds can also be administered intranasally as, for example, liquid drops or spray.

88

./.

The tablets, pills, capsules, and the like may also contain a binder such as gum tragacanth, acacia, corn starch or gelatin; excipients such as dicalcium phosphate; a disintegrating agent such as corn starch, potato starch, alginic acid; a lubricant such as magnesium stearate; and a sweetening agent such as sucrose, lactose or saccharin. When a dosage unit form is a capsule, it may contain, in addition to materials of the above type, a liquid carrier such as a fatty oil.

Various other materials may be present as coatings or to modify the physical form of the dosage unit. For instance, tablets may be coated with shellac, sugar or both. A syrup or elixir may contain, in addition to the active ingredient, sucrose as a sweetening agent, methyl and propylparabens as preservatives, a dye and a flavoring such as cherry or orange flavor.

These active compounds may also be administered parenterally. Solutions or suspensions of these active compounds can be prepared in pyrogen-free water.

The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions.

If desired, or deemed necessary, the pharmaceutical compositions may be in the controlled-release form. Various techniques for preparing these forms are known.

General reference for pharmaceutical compositions can be made to "Remington's Pharmaceutical Sciences Handbook", Mack Pub. N.Y. USA.

The effective dosage of active ingredient employed may vary depending on the particular compound employed, the mode of administration, the condition being treated and the severity of the condition being treated.

The compositions are formulated and administered in the same general manner as detailed below. The compounds of the present invention can be used effectively alone or in combination with one or more additional active agents depending on the desired target therapy. Combination therapy includes administration of a single pharmaceutical dosage formulation which contains a compound of formula I and one or more additional active agents, as well as administration of a compound of formula I and each active agent in its own separate pharmaceutical dosage formulation. For example, a compound of formula I and an HMG-CoA reductase inhibitor can be administered to the patient together in a single oral dosage composition such as a tablet or capsule, or each agent administered in separate oral dosage formulations. Where separate dosage formulations are used, a compound of formula I and one or more additional active agents can be administered at essentially the same time, i.e., concurrently, or sequentially; combination therapy is understood to include all these regimens.

An example of combination treatment or prevention of atherosclerosis is wherein a compound of formula I is administered in combination with one or more of the following active agents: an antihyperlipidemic agent; a plasma HDL-raising agent; an antihypercholesterolemic agent such as a cholesterol biosynthesis inhibitor, for example an HMG-CoA reductase inhibitor, an HMG-CoA synthase inhibitor, a squalene epoxidase inhibitor, or a squalene synthetase inhibitor (also known as squalene synthase inhibitor); an acyl-coenzyme A: cholesterol acyltransferase (ACAT) inhibitor such as melinamide; probucol; nicotinic acid and the salts thereof and niacinamide; a cholesterol absorption inhibitor such as beta-sitosterol; a bile acid sequestrant anion exchange resin such as cholestyramine, colestipol or dialkylaminoalkyl derivatives of a cross-linked dextran; an LDL (low density lipoprotein) receptor inducer; fibrates such as clofibrate, bezafibrate, fenofibrate, and gemfibrozil and other PPAR- α agonists, L-carnitine; vitamin B₆ and the pharmaceutically acceptable salts thereof; vitamin B₁₂; antioxidant vitamins such as vitamin C and E and beta carotene; a beta-blocker; an angiotensin II antagonist; an angiotensin converting enzyme inhibitor; and a platelet aggregation inhibitor such as fibrinogen receptor antagonists (i.e., glycoprotein IIb/IIIa fibrinogen receptor antagonists) and aspirin. The compounds of formula I can be administered in combination with more than one additional active agent.

Another example of combination therapy can be seen in treating obesity or obesity-related disorders, wherein the compounds of formula I may be effectively used in combination with for example, fenfluramine, dexfenfluramine, phentiramine and β -3 adrenergic receptor agonist agents and L-carnitine.

Another example of combination therapy can be seen in treating diabetes and related disorders wherein the compounds of formula I can be effectively used in combination with for example sulfonylureas, biguanides, α -glucosidase inhibitors, other insulin secretagogues, insulin and glucagon-like peptides (incretins) and agonists of PPAR- γ (such as thiazolidinediones or others) as well as the active agents discussed above for treating atherosclerosis.
